5.2. Chip LED Electrical / Optical Characteristics at Ta=25°C

Parameter	Symbol	MIN.	TYP.	MAX.	Unit	Test Condition
Average Luminous Intensity Per Chip	IV	71		165	mcd	IF=5mA Note 1, 2
Chromaticity Coordinates	x		0.294		nm	IF=5mA Note 2
	y		0.286		nm	
Forward Voltage Per Chip	VF	2.7		3.2	V	IF=5mA
Reverse Current Per Chip ⁽⁴⁾	IR			100	μA	VR=5V
Luminous Intensity Matching Ratio (Similar Light Area)	IV-m			2:1		IF=5mA

Notes :

- Luminous intensity is measured with a light sensor and filter combination that approximates the CIE eye-response curve.
- The chromaticity coordinates (x, y) is derived from the 1931 CIE chromaticity diagram.
- Caution in ESD:
Static Electricity and surge damages the LED. It is recommend to use a wrist band or anti-electrostatic glove when handling the LED. All devices, equipment and machinery must be properly grounded.
- Reverse voltage is only for IR test. It can not continue to operate at this situation.
- Cross talk specification $\leq 2.5\%$

5.3.ESD (Electrostatic Discharge)

Static Electricity or power surge will damage the LED. Suggestions to prevent ESD damage:

- Use of a conductive wrist band or anti-electrostatic glove when handling these LEDs.
- All devices, equipment, and machinery must be properly grounded.
- Work tables, storage racks, etc. should be properly grounded.
- Use ion blower to neutralize the static charge which might have built up on surface of the LED's plastic for N/D as a result of friction between LEDs during storage and handling.
